KAVIN S

Data Analyst | Power BI | DAX | SQL, ETL & Data Modeling | Data Visualization

Bengaluru, India | +91 90800 88177 | kavinsrinivasan24@gmail.com
LinkedIn/kavinsrinivasan12 | GitHub/kavinsrinivasan12 | Portfolio

CAREER OBJECTIVE

Entry-level Data Analyst skilled in SQL, Power BI, DAX, Python and Excel for ETL, data modeling, root cause analysis and interactive dashboard development. Hands-on with star schema design, window functions, EDA and KPI reporting across BFSI, retail and bike-share datasets. Brings a problem-solving approach to uncovering hidden issues, from product return spikes to loan default risk and turning them into actionable recommendations.

SKILLS

SQL & Data Warehousing: SQL (Joins, Window Functions, CTEs, Subqueries, Stored Procedures), PostgreSQL, Snowflake, Data Modeling (Star Schema).

Data Visualization & BI Development: Power BI, DAX, Power Query (ETL), Interactive Dashboards, KPI Reporting, Data Storytelling, AI Visuals.

Data Analysis & Wrangling: Python (Pandas, NumPy, Matplotlib), EDA, Feature Engineering, Data Cleaning, Excel (Pivots, Dynamic Arrays, Macros).

Business Analytics & Reporting: Stakeholder Reporting, Risk & Performance Analysis, Customer Segmentation, Trend Analysis, Anomaly Detection.

Tools & Platforms: pgAdmin 4, Power BI Desktop, Google Colab, GitHub.

PROFESSIONAL EXPERIENCE

Data Analyst Intern | Bdreamz Global Solution Pvt Ltd, Bengaluru *May 2026 – Oct 2026*

- Used Snowflake SQL (joins, subqueries, CTEs, window functions) on enterprise transactional data to find what was driving revenue and return-rate issues.
- Built stored procedures to automate recurring sales and returns metrics, keeping reports consistent and reliable for stakeholders.
- Cleaned data in Power Query, modeled a star schema and wrote DAX measures for dashboards that track sales, product and customer KPIs in one place.

Associate Business Analyst | ITOrizon India Pvt Ltd, Bengaluru *Jan 2025 – Mar 2025*

- Trained in Supply Chain Management (SCM) concepts and workflows; studied Business Requirement Documents (BRDs) covering business and functional requirements.
- Attended a Knowledge Transfer session on SCM and Manhattan services, gaining exposure to supply chain solutions and operational workflows.

KEY PROJECTS

Bike Share User Behavior & Fleet Transit Analytics | Snowflake SQL | Python | [GitHub] *Oct 2026*

Problem: The bike trip data was messy: 2.5M raw records, over 21% with missing station details, and some wildly unrealistic trip durations. That made it hard to tell daily commuter routes from leisure rides, or to see where bikes were running short.

Solution: I built a Python and Snowflake SQL pipeline that cleaned and filtered the data to 2.44M reliable records, then wrote SQL queries with window functions (DENSE_RANK, LAG, rolling average) to study station imbalances, demand and rider behavior.

Impact: Members ride in clear weekday commuter peaks, while casual riders surge on weekends. I pinpointed the top 10 busiest corridors and the stations that run low on bikes in the morning, which is exactly what a team needs to plan rebalancing.

Adventure Works Dashboard | Power BI | Dashboard Building | [GitHub] *Aug 2026*

Problem: Sales, product and customer data sat in separate raw files with no clear structure, so it was hard to get a real read on revenue trends or how products were performing.

Solution: I cleaned the data and shaped it into a star schema in Power BI, then built a 4-page dashboard (KPIs, sales trends, returns, customers) with 20+ custom DAX measures, Key Influencers, decomposition trees, bookmarks, anomaly detection and drill-through filters.

Impact: Sport-100 Helmets were one of the top-selling products, but their return rate was nearly 50% above the 2.2% dashboard average. It was a good reminder that strong overall numbers can hide product problems worth flagging.

Bank Loan Management System | SQL | BigQuery | Data Analysis | [GitHub] *Aug 2026*

Problem: Loan and repayment data was scattered across branches, so risk teams had no single view to track delinquency trends across 3K+ active loans.

Solution: I brought 305K+ records together into an 8-table relational schema in BigQuery and wrote SQL (multi-table joins, CTEs, window functions) to look at loan servicing, borrower credit tiers and branch performance.

Impact: I delivered 13 banking metrics. Auto loans turned out to be the riskiest portfolio at an 11.2% default rate, 18% of borrowers held more than one active loan, and 3K+ dormant accounts were flagged so branches could win those customers back.

CERTIFICATIONS

Data Analytics Job Simulation – Deloitte • Advanced SQL – HackerRank • Python for AI & Data Science – IBM

EDUCATION

B.Tech – Artificial Intelligence & Data Science | Mahendra Engineering College, Tamil Nadu | CGPA: 8.38 2020 – 2024
